
Endorsement rate of the 9 SCA wheel families (share of tastings in which a participant's descriptor contains a word that maps to the family, averaged over participants), stimulation (red) vs sham (blue). Descriptive.
Tests (paired sign-flip permutation, exploratory): aroma omnibus over the 9 families p = 0.018, q = 0.035 (cosine-mapping sensitivity q = 0.057); flavor omnibus p = 0.54, q = 0.54; no single family reaches q < 0.25 (BH over 18 family tests), so the differences between the polygons for individual families are not significant.
